"It's important for us to bring the community together to share, connect and celebrate what the .NET platform means to all of us as technology professionals," said Chris Akkari, vice president of the Developer Division, in a statement. The conference will take place June 7-9. Additionally, the first-ever .NET conference outside of the U.S. will take place in Tel Aviv, Israel, in November. For more information, visit [NETconf.com](http://NETconf.com). The .NET ecosystem comprises a set of software technologies that, in recent years, have been used to build applications for mobile devices, the web, Windows, and the cloud. .NET features a programming model and infrastructure that enables developers to design, build, test, deploy and manage apps and services on any device. "This is the kind of community building we live for!" said Joe Duffy, CTO at appliances4. "I look forward to having a great time with all of you." Building apps is one thing, but for now, .NET 5.0 is a collection of new APIs that will be used to create new services, rather than a comprehensive SDK (software development kit). However, .NET 5.0 will still contain the Web API, standard for building REST services. But now, the standard will support more than just JSON and XML formats. Now, there will be a synchronous and asynchronous programming model for common tasks, such as file operations, network operations and data operations. These features make .NET 5.0 more complex than the earlier versions. As such, developers will need to be well-versed in object-oriented programming to use the new APIs.
